In this problem there will be a list of years and goals which represents how many goals brazil scored in world cup held in the given years in the list. Then there will some queries where a year will be given, you have to tell how many goals brazil scored in the world cup held in the given year and immediately before that world cup and immediately after that world cup.

This problem can be solved easily, at first you have to sort the list based on years. Then you have to map every year in the sorted array to index of that year in the array.

In each query you can find the index of the given year from the map and print the goals of that world cup and immediately before and after that world cup.

This problem can be solved using binary search also.
